

# Geometric Analysis of Dispersive Flows

Hiroyuki CHIHARA

College of Education  
University of the Ryukyus

13th Kagoshima AAG Seminar  
11-15 February 2019, Kagoshima U

# Contents

1. Model equations arising in classical physics
2. Schrödinger flow into almost Hermitian manifolds
3. Third order flow into almost Hermitian manifolds
4. Fourth order flow into Kähler manifolds

# 1-1. Model equations arising in classical physics

$$\vec{u}_t = \vec{u} \times \vec{u}_{xx}, \quad (1)$$

$$\vec{u} = {}^t(u_1, u_2, u_3) : \mathbb{R} \times \mathbb{R} \ni (t, x) \mapsto \vec{u}(t, x) \in \mathbb{S}^2.$$

- $\vec{u}$  describes not only a point in the unit 2-sphere  $\mathbb{S}^2$ , but also the unit normal vector of the tangential plane of  $\mathbb{S}^2$  at  $\vec{u}$ .
- $\vec{u} \times \vec{u}_{xx} = \vec{u} \times (\vec{u}_{xx})^T$  where ,

$$(\vec{u}_{xx})^T := \vec{u}_{xx} - \langle \vec{u}_{xx}, \vec{u} \rangle \vec{u} \in T_{\vec{u}(t,x)}\mathbb{S}^2$$

is the tangential component of  $\vec{u}_{xx}$  at  $\vec{u}$ .  $\vec{u} \perp (\vec{u}_{xx})^T$ , where  $\langle \cdot, \cdot \rangle$  is the standard inner product of  $\mathbb{R}^3$ .

- $\vec{u} \perp \vec{u} \times (\vec{u}_{xx})^T$  and  $(\vec{u}_{xx})^T \perp \vec{u} \times (\vec{u}_{xx})^T$  since

$$\langle \vec{a}, \vec{b} \times \vec{c} \rangle = \det[\vec{a}, \vec{b}, \vec{c}], \quad \vec{a}, \vec{b}, \vec{c} \in \mathbb{R}^3.$$

## 1-2. The meaning of $\vec{u} \times \vec{u}_{xx}$

- $\{\vec{u}, (\vec{u}_{xx})^T, \vec{u} \times (\vec{u}_{xx})^T\}$  is a right-handed orthogonal system of  $\mathbb{R}^3$  if  $(\vec{u}_{xx})^T \neq \vec{0}$ :

- If  $(\vec{u}_{xx})^T$  rotates **90-degree** in the anti-clockwise direction on  $T_{\vec{u}(t,x)}\mathbb{S}^2$ , then it becomes  $\vec{u} \times \vec{u}_{xx}$ , that is  $\vec{u} \times (\vec{u}_{xx})^T$ .

### 1-3. What does $\vec{u}_t = \vec{u} \times \vec{u}_{xx}$ model?

The system (1) models the following phenomena in classical physics:

- The motion of vortex filament (Da Rios, 1906),  
Let  $\vec{w}(t, \cdot)$  be a curve in  $\mathbb{R}^3$  at the time  $t \in \mathbb{R}$  parametrized by the arclength  $x \in \mathbb{R}$ . Set  $\vec{u} = \vec{w}_x$ .

- Heisenberg's ferromagnetic model (continuum limit of classical spin chain system).

## 1-4. The structure of the system of PDEs $\vec{u}_t = \vec{u} \times \vec{u}_{xx}$

If  $\vec{u}(t, \mathbf{x})$  never takes a value of a fixed point, e.g., the north pole  ${}^t(\mathbf{0}, \mathbf{0}, 1) \in S^2$ , then the system (1) becomes a semilinear Schrödinger equation of the form

$$\mathbf{v}_t - \sqrt{-1} \mathbf{v}_{xx} = \frac{2\sqrt{-1} \bar{\mathbf{v}} (\mathbf{v}_x)^2}{1 + |\mathbf{v}|^2} \quad (2)$$

where,  $\mathbf{v}$  is the stereographic projection of  $\vec{u}$  defined by

$$S^2 \ni \vec{u} = (u_1, u_2, u_3) \mapsto \mathbf{v} = \frac{u_1 + \sqrt{-1} u_2}{1 - u_3} \in \mathbb{C}.$$

The solutions to (2) may be uninteresting in physics. In particular, small solutions to (2) are definitely uninteresting since those are very close to the constant map  $\vec{u}(t, \mathbf{x}) \equiv {}^t(\mathbf{0}, \mathbf{0}, 1)$ .

## 1-5. Higher order models

- A third order model

$$\vec{u}_t = \vec{u} \times \vec{u}_{xx} + \mathbf{a} \left[ \vec{u}_{xxx} + \frac{3}{2} \{ \vec{u}_x \times (\vec{u} \times \vec{u}_x) \}_x \right], \quad (3)$$

where  $\mathbf{a} \in \mathbb{R} \setminus \{0\}$ , was proposed by Fukumoto and Miyazaki (1991) for the motion of vortex filaments.

- A fourth order model

$$\vec{u}_t = \vec{u} \times \{ \mathbf{a} \vec{u}_{xxxx} + \vec{u}_{xx} + \mathbf{b} \langle \vec{u}_x, \vec{u}_x \rangle \vec{u}_{xx} + \mathbf{c} \langle \vec{u}_{xx}, \vec{u}_x \rangle \vec{u}_x \}, \quad (4)$$

where  $\mathbf{a}, \mathbf{b}, \mathbf{c} \in \mathbb{R}$  satisfy  $3\mathbf{a} + \mathbf{c} = 2\mathbf{b}$  and  $\mathbf{a} \neq 0$ , was proposed by Porsezian, Daniel and Lakshmanan (1992) for spin chain system and by Fukumoto (2002) for the motion of vortex filaments respectively.

- If all the constants are zero, then the model equations (3) and (4) become (1) respectively.

## 1-6. Geometric generalization of model systems

Model systems (1), (3) and (4) can be geometrically generalized as follows

$$\mathbf{u}_t = \mathbf{J}_u \nabla_x \mathbf{u}_x, \quad (5)$$

$$\mathbf{u}_t = \mathbf{J}_u \nabla_x \mathbf{u}_x + \mathbf{a} \nabla_x^2 \mathbf{u}_x + \mathbf{b} \mathbf{h}_u(\mathbf{u}_x, \mathbf{u}_x) \mathbf{u}_x, \quad (6)$$

$$\begin{aligned} \mathbf{u}_t = & \mathbf{J}_u \nabla_x \mathbf{u}_x + \mathbf{a} \mathbf{J}_u \nabla_x^3 \mathbf{u}_x \\ & + \mathbf{b} \mathbf{h}_u(\mathbf{u}_x, \mathbf{u}_x) \mathbf{J}_u \nabla_x \mathbf{u}_x + \mathbf{c} \mathbf{h}_u(\nabla_x \mathbf{u}_x, \mathbf{u}_x) \mathbf{J}_u \mathbf{u}_x, \end{aligned} \quad (7)$$

where  $\mathbf{a}, \mathbf{b}, \mathbf{c} \in \mathbb{R}$  are constants,  $\mathbf{u} : \mathbb{R} \times \mathbb{R} \rightarrow \mathbf{N}$ ,  $(\mathbf{N}, \mathbf{J}, \mathbf{h})$  is a  $2n$ -dimensional compact almost Hermitian manifold,  $\nabla_x$  is the covariant derivative along the mapping  $\mathbf{u}$ , which is roughly speaking

$$\nabla_x \mathbf{u}_x = \text{the projecton of } \mathbf{u}_{xx} \text{ onto } T_{\mathbf{u}(t,x)} \mathbf{N}.$$

(5), (6) and (7) are identities in  $T_{\mathbf{u}(t,x)} \mathbf{N}$  for each  $(t, x) \in \mathbb{R} \times \mathbf{M}$ . The purpose of the geometric generalization is to understand the structure of the systems essentially.

## 1-7. Target manifold $(N, J, h)$

We assume that  $(N, J, h)$  is a compact almost Hermitian manifold, which is the least setting on  $(N, J, h)$  so that the identities (5), (6) and (7) make sense. More precisely we assume the following

- $J$  is an almost complex structure, that is,  $J_u$  is a linear transformation and  $J_u \circ J_u = -I_d$  on  $T_u N$  for all  $u \in N$ .
- $h$  is a Riemannian metric satisfying  $h(J\cdot, J\cdot) = h(\cdot, \cdot)$ .

$(N, J, h)$  is said to be a Kähler manifold if

- $J$  is integrable, that is,  $(N, J)$  is a complex manifold.
- The Kähler form  $h(J\cdot, \cdot)$  is closed, that is,  $d(h(J\cdot, \cdot)) = 0$ .

It is well-known that these conditions are equivalent to

$$\nabla^N J = 0, \tag{8}$$

where  $\nabla^N$  is the Levi-Civita connection of  $(N, J, h)$ . We sometimes assume that  $(N, J, h)$  is a compact Kähler manifold. In this case, (5) and other equations become easy to handle.

## 2-1. Schrödinger flow into almost Hermitian manifolds

The equation (5) can be more generalized as follows:

$$\mathbf{u}_t = \mathbf{J}_u \tau(\mathbf{u}) \quad \text{in } \mathbb{R} \times \mathbf{M} \quad (9)$$

where  $\mathbf{u} : \mathbb{R} \times \mathbf{M} \rightarrow \mathbf{N}$ ,  $(\mathbf{M}, \mathbf{g})$  is an  $m$ -dimensional closed Riemannian manifold,  $(\mathbf{N}, \mathbf{J}, \mathbf{h})$  is a  $2n$ -dimensional compact almost Hermitian manifold,  $\tau(\mathbf{u})$  is the tension field of the mapping  $\mathbf{u}(t, \cdot) : \mathbf{M} \rightarrow \mathbf{N}$ , which is roughly speaking

$$\tau(\mathbf{u})(t, \mathbf{x}) = \text{the projection of } \Delta_{\mathbf{g}} \mathbf{u}(t, \mathbf{x}) \text{ onto } \mathbf{T}_{\mathbf{u}(t, \mathbf{x})} \mathbf{N}.$$

Solutions to (9) is said to be Schrödinger maps.

- Stationary solutions to (9) satisfy  $\tau(\mathbf{u}) = \mathbf{0}$  and are said to be harmonic maps.
- If  $\mathbf{M} = S^1 \simeq \mathbb{T} := \mathbb{R}/\mathbb{Z}$ , then the solutions to (9) describes the motion of closed curves on  $\mathbf{N}$ .

We study the IVP for (9) with the initial condition of the form

$$\mathbf{u}(\mathbf{0}, \mathbf{x}) = \mathbf{u}_0(\mathbf{x}) \quad \text{in } \mathbf{M}. \quad (10)$$

## 2-2. Geometric reduction of Schrödinger flows

- Chang-Shatah-Uhlenbeck (CPAM, 2000)

$M = \mathbb{R}$ ,  $(N, J, h)$  is a compact Riemann surface, and

$\exists u_\infty \in N$  s.t.  $u(t, x) \rightarrow u_\infty$  as  $x \rightarrow \infty$  for  $\forall t \in \mathbb{R}$ .

$\Rightarrow \exists$  a moving frame along the curve  $u(t, \cdot)$ .

- Nahmod-Shatah-Vega-Zeng (IMRN, 2008)

$M = \mathbb{R}^m$ ,  $\nabla^N J = 0 \Rightarrow \exists$  a moving frame along the map  $u(t, \cdot)$ .

- The Kähler condition  $\nabla^N J = 0$  plays an essential role in the construction of the moving frames:  $\nabla_x e = 0 \Leftrightarrow \nabla_x Je = 0$ .

## 2-3. Analysis of the IVPs

- Sulem-Sulem-Bardos (CMP, 1985)

Short-time existence and time-global weak solutions for (1).

- Koiso (Osaka J. Math., 1997)  $M = S^1$  and  $\nabla^N J = 0$ .

- 1 Reformulation of (1) as (9).

- 2 Short-time existence.

- 3  $\nabla^N R = 0 \Rightarrow$  Time-global existence.

$$R(X, Y)Z = \nabla_X^N \nabla_Y^N Z - \nabla_Y^N \nabla_X^N Z - \nabla_{[X, Y]}^N Z$$

for  $X, Y, Z \in \mathcal{X}(N)$ .

- The Kähler condition  $\nabla^N J = 0$  guarantees the classical energy estimates for (9).

- C (BLMS, 2013): Short-time existence without  $\nabla^N J = 0$ .

## 2-4. Short-time existence 1/3

### Theorem 1 (C (BLMS, 2013))

Let  $k \in \mathbb{N}$  satisfying  $2k > m/2 + 5$ , and let  $k_0 = \min k$ .  
Then,  $\forall \mathbf{u}_0 \in H^{2k}(M; TN)$ ,  $\exists T = T(\|\mathbf{u}_0\|_{H^{2k_0}}) > 0$ , such that  
(9)-(10) has a unique solution  $\mathbf{u} \in C([-T, T]; H^{2k}(M; TN))$ .

#### Remarks

- Set  $G = \det[g_{ij}]$  and  $\nabla_i = \nabla_{du(\partial/\partial x^i)}^N$ . Then,

$$\tilde{\Delta}_g = \frac{1}{\sqrt{G}} \sum_{i,j=1}^m \nabla_i g^{ij} \sqrt{G} \nabla_j \text{ is globally well-defined.}$$

- $\|\mathbf{u}\|_{H^{2k}(M; TN)}^2 \sim \sum_{l=1}^k \int_M h(\tilde{\Delta}_g^l \mathbf{u}, \tilde{\Delta}_g^l \mathbf{u}) d\mu_g, \quad \tilde{\Delta}_g^l \mathbf{u} = \tilde{\Delta}_g^{l-1} \tau(\mathbf{u}).$
- $\mathbf{u} \in H^{2k_0}(M; TN) \Rightarrow \nabla_i \mathbf{u} \in C^4(M; TN).$

Our calculus requires this smoothness of  $\nabla_i \mathbf{u}$ .

## 2-4. Short-time existence 2/3

We show the idea of proof. Set  $\mathbf{v} = \tilde{\Delta}_g^{k-1} \tau(\mathbf{u})$ . Then,

$$\left\{ \nabla_t - \frac{1}{\sqrt{\mathbf{G}}} \sum_{i,j=1}^m \nabla_i g^{ij} \sqrt{\mathbf{G}} \mathbf{J}_u \nabla_j - \mathbf{P} \right\} \mathbf{v} = \text{harmless terms}, \quad (11)$$

where

$$\mathbf{P} = (2k - 1) \sum_{i,j=1}^m g^{ij} \{ \nabla_i \mathbf{J}_u \} \nabla_j$$

is an anti-symmetric first-order term, and an obstruction to establishing short-time existence theorem. To eliminate this, we introduce a PsDO  $\Lambda = \mathbf{1} - \tilde{\Lambda}$  acting on  $\Gamma(\mathbf{u}^{-1} \mathbf{T}\mathbf{N})$  as follows.  $\tilde{\Lambda}$  is of order  $-1$ . Roughly speaking,

$$\tilde{\Lambda} = \frac{\mathbf{P} \mathbf{J}_u (\mathbf{1} - \Delta_g)^{-1}}{2} \simeq - \frac{\mathbf{J}_u \mathbf{P} (\mathbf{1} - \Delta_g)^{-1}}{2}$$

locally. Fortunately, this expression is invariant under the change of variables of  $\mathbf{M}$  and  $\mathbf{N}$ , and makes sense globally.

## 2-4. Short-time existence 3/3

Set

$$\tilde{\Lambda} = \sum_{\alpha} \sum_{\beta} \phi_{\alpha}(\mathbf{x}) \psi_{\beta}(\mathbf{u}) \tilde{\Lambda}_{\alpha,\beta} \Phi_{\alpha}(\mathbf{x}) \Psi_{\beta}(\mathbf{u}),$$

where

$$\phi_{\alpha}, \Phi_{\alpha} \in \mathbf{C}_0^{\infty}(M), \quad \sum_{\alpha} \phi_{\alpha} = \mathbf{1}, \quad \Phi_{\alpha} = \mathbf{1} \text{ in } \text{supp}[\phi_{\alpha}],$$

$$\psi_{\beta}, \Psi_{\beta} \in \mathbf{C}_0^{\infty}(N), \quad \sum_{\beta} \psi_{\beta} = \mathbf{1}, \quad \Psi_{\beta} = \mathbf{1} \text{ in } \text{supp}[\psi_{\beta}],$$

and  $\tilde{\Lambda}_{\alpha,\beta}$  is a local expression of  $\tilde{\Lambda}$ . Then,  $\Lambda$  works well and

$$\left\{ \nabla_t - \frac{\mathbf{1}}{\sqrt{\mathbf{G}}} \sum_{i,j=1}^m \nabla_i \mathbf{g}^{ij} \sqrt{\mathbf{G}} \mathbf{J}_u \nabla_j \right\} \Lambda \mathbf{v} = \text{harmless terms.}$$

### 3. Third-order flows for closed curves

We study the IVP for (6) of the form

$$u_t = a \nabla_x^2 u_x + J_u \nabla_x u_x + b h_u(u_x, u_x) u_x \quad \text{in } \mathbb{R} \times \mathbb{T}, \quad (12)$$

$$u(0, x) = u_0(x) \quad \text{in } \mathbb{T}, \quad (13)$$

where  $a, b \in \mathbb{R}$  and  $a \neq 0$ . Known results are the following

- Onodera (SIGMA, 2008): Geometric reduction in case that  $(N, J, h)$  is a compact Riemann surface.
- Onodera (JGA, 2008):
  - ▶ Short-time existence for  $\nabla^N J = 0$ .
  - ▶ Time-global existence for the case that  $(N, J, h)$  is a compact Riemann surface with constant curvature  $K$  and  $b = aK/2$ .
- C-Onodera (JFA, 2009): Short-time existence without  $\nabla^N J = 0$ .
- Onodera (CommPDE, 2010): Time-global existence for the case that  $(N, J, h)$  is a Kähler manifold with  $\nabla^N R = 0$ .

## 4-1. Fourth-order flows for closed curves

We study the IVP for (6) of the form

$$u_t = \mathbf{a} \mathbf{J}_u \nabla_x^3 u_x + \{ \mathbf{1} + \mathbf{b} h_u(u_x, u_x) \} \mathbf{J}_u \nabla_x u_x + \mathbf{c} h_u(\nabla_x u_x, u_x) \mathbf{J}_u u_x. \quad \text{in } \mathbb{R} \times \mathbb{T}, \quad (14)$$

$$u(0, \mathbf{x}) = u_0(\mathbf{x}) \quad \text{in } \mathbb{T}, \quad (15)$$

where  $\mathbf{a}, \mathbf{b}, \mathbf{c} \in \mathbb{R}$  and  $\mathbf{a} \neq \mathbf{0}$ . Known results are the following

- Onodera (SIGMA, 2008): Geometric reduction.
- C (J. PsDOs Appl., 2015):
  - ▶ Geometric reduction for higher-order derivatives.
  - ▶ It is almost impossible to construct a solution to the IVP (14)-(15) unless the sectional curvature  $\mathbf{K}(\mathbf{u})$  of  $\mathbf{N}$  is constant.
- Onodera (Edinburgh, 2017; JGA, 2017; ...): Short-time existence for 2-sphere, Riemann surface with constant curvature and more...
- C-Onodera (Z. Anal. Anwend., 2015): c.f. short-time existence for  $\mathbf{x} \in \mathbb{R}$  and  $\nabla^N \mathbf{J} = \mathbf{0}$ .

## 4-2. IVP for a linear dispersive system 1/2

$$\left\{ I_2 \frac{\partial}{\partial t} + J_2 \frac{\partial^4}{\partial \mathbf{x}^4} + \mathbf{B}(\mathbf{x}) \frac{\partial^2}{\partial \mathbf{x}^2} + \mathbf{C}(\mathbf{x}) \frac{\partial}{\partial \mathbf{x}} \right\} \vec{u} = \vec{f}(t, \mathbf{x}), \quad (16)$$

$$\vec{u}(0, \mathbf{x}) = \vec{u}_0(\mathbf{x}), \quad (17)$$

where

- $\mathbb{R} \times \mathbb{T} \ni (t, \mathbf{x}) \mapsto \vec{u}(t, \mathbf{x}) \in \mathbb{R}^2$  is unknown.
- $I_2, J_2, \mathbf{B}(\mathbf{x})$  and  $\mathbf{C}(\mathbf{x})$  are  $2 \times 2$  real matrices:

$$I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \quad J_2 = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}, \quad \mathbf{B}(\mathbf{x}), \mathbf{C}(\mathbf{x}) \in C^\infty(\mathbb{T}; M_2(\mathbb{R})).$$

Note that if

$$\mathbf{B}(\mathbf{x}) + {}^t\mathbf{B}(\mathbf{x}) = \mathbf{0}, \quad \mathbf{C}(\mathbf{x}) - {}^t\mathbf{C}(\mathbf{x}) = \mathbf{0},$$

then the classical energy estimates work for (9).

## 4-2. IVP for a linear dispersive system 2/2

### Theorem 2 (C (2015))

The following conditions are mutually equivalent.

- (I) For any  $\vec{\mathbf{u}}_0 \in \mathbf{L}^2(\mathbb{T}; \mathbb{R}^2)$  and for any  $\vec{\mathbf{f}} \in \mathbf{L}_{loc}^1(\mathbb{R}; \mathbf{L}^2(\mathbb{T}; \mathbb{R}^2))$ , the IVP (16)-(17) has a unique solution  $\vec{\mathbf{u}} \in \mathbf{C}(\mathbb{R}; \mathbf{L}^2(\mathbb{T}; \mathbb{R}^2))$ .
- (II)  $\int_0^1 \operatorname{tr}(\mathbf{B}(\mathbf{x})) \, d\mathbf{x} = \mathbf{0}$  and  $\int_0^1 \operatorname{tr}(\mathbf{J}_2 \mathbf{C}(\mathbf{x})) \, d\mathbf{x} = \mathbf{0}$ .

- $\operatorname{tr}(\mathbf{B}(\mathbf{x})) = \mathbf{b}_{11}(\mathbf{x}) + \mathbf{b}_{22}(\mathbf{x})$ ,  $\operatorname{tr}(\mathbf{J}_2 \mathbf{C}(\mathbf{x})) = \mathbf{c}_{12}(\mathbf{x}) - \mathbf{c}_{21}(\mathbf{x})$ .
- (I) implies the continuity of  $(\vec{\mathbf{u}}_0, \vec{\mathbf{f}}) \mapsto \vec{\mathbf{u}}$  automatically.
- **Proof.**

Consider more general systems. By using PsDOs, we can diagonalize (9) essentially. The proof is reduced to Mizuhara's results on single equations (2006).

## 4-3. Geometric reduction of dispersive flows 1/3

- Let  $\mathbf{u} \in \mathbf{C}^\infty(\mathbb{R} \times \mathbb{T}; \mathbf{N})$  be a solution to (14).  
Suppose that  $\mathbf{u}_x(t, 0) \neq \mathbf{0}$  for all  $t \in \mathbb{R}$ . Set

$$\mathbf{e}_0(t) = \frac{\mathbf{u}_x(t, 0)}{\sqrt{\mathbf{g}_{\mathbf{u}(t,0)}(\mathbf{u}_x, \mathbf{u}_x)}}, \quad \gamma(t) = \{\mathbf{u}(t, \mathbf{x}) \mid \mathbf{x} \in \mathbb{T}\}.$$

- Let  $\mathbf{e}(t, \mathbf{x})$  be a solution to  $\nabla_x \mathbf{e} = \mathbf{0}$ ,  $\mathbf{e}(t, 0) = \mathbf{e}_0(t)$ .  
 $\{\mathbf{e}, \mathbf{J}\mathbf{e}\}$  is a moving frame along  $\gamma(t)$ .  
 $\nabla_x \mathbf{J}\mathbf{e} = \mathbf{0}$ ,  $\mathbf{J}\mathbf{e}(t, 0) = \mathbf{J}\mathbf{e}_0(t)$  since  $\nabla^N \mathbf{J} = \mathbf{0}$ .

$\mathbf{e}(t, 0) \neq \mathbf{e}(t, 1)$  in general.

- Let  $\theta(t)$  be the holonomy angle of  $\gamma(t)$ .  
If  $\gamma(t)$  is the boundary of a contractive domain  $\Omega(t)$ , then

$$\theta(t) = \int_{\Omega(t)} \mathbf{K}(\mathbf{u}) d\mathbf{u}^1 \wedge d\mathbf{u}^2.$$

## 4-3. Geometric reduction of dispersive flows 2/3

- Set  $\nabla_x^\ell \mathbf{u}_x = \mathbf{V}\mathbf{e} + \mathbf{W}\mathbf{J}\mathbf{e}$  for  $\ell = 4, 5, 6, \dots$
- Let  $\mathbf{R}$  be the Riemann curvature tensor of  $(\mathbf{N}, \mathbf{J}, \mathbf{h})$ .
- Using the following properties

$$\mathbf{K}(\mathbf{u}) = h_u(\mathbf{R}(\mathbf{J}\mathbf{e}, \mathbf{e})\mathbf{e}, \mathbf{J}\mathbf{e}), \quad \mathbf{J}\mathbf{R}(\mathbf{X}, \mathbf{Y})\mathbf{Z} = \mathbf{R}(\mathbf{X}, \mathbf{Y})\mathbf{J}\mathbf{Z},$$

$$\mathbf{R}(\mathbf{J}\mathbf{e}, \mathbf{e})\mathbf{e} = \mathbf{K}(\mathbf{u})\mathbf{J}\mathbf{e}, \quad \mathbf{J}\mathbf{R}(\mathbf{J}\mathbf{e}, \mathbf{e})\mathbf{e} = -\mathbf{K}(\mathbf{u})\mathbf{e}, \dots,$$

we obtain

$$\left\{ \mathbf{I}_2 \frac{\partial}{\partial t} - \mathbf{a}\mathbf{J}_2 \frac{\partial^4}{\partial \mathbf{x}^4} + \hat{\mathbf{B}}(\mathbf{t}, \mathbf{x}) \frac{\partial^2}{\partial \mathbf{x}^2} + \hat{\mathbf{C}}(\mathbf{t}, \mathbf{x}) \frac{\partial}{\partial \mathbf{x}} \right\} \begin{bmatrix} \mathbf{V} \\ \mathbf{W} \end{bmatrix} = \dots,$$

- Unfortunately,  $\mathbf{V}(\mathbf{t}, \mathbf{x})$  and  $\mathbf{W}(\mathbf{t}, \mathbf{x})$  are not necessarily periodic in  $\mathbf{x}$  because of the holonomy angle  $\theta(\mathbf{t})$ .

## 4-3. Geometric reduction of dispersive flows 3/3

- Correction

$$\vec{z} = \begin{bmatrix} \cos(\theta(t)\mathbf{x}) & -\sin(\theta(t)\mathbf{x}) \\ \sin(\theta(t)\mathbf{x}) & \cos(\theta(t)\mathbf{x}) \end{bmatrix} \begin{bmatrix} \mathbf{V} \\ \mathbf{W} \end{bmatrix}.$$

- $\vec{z} \in \mathbf{C}^\infty(\mathbb{R} \times \mathbb{T}; \mathbb{R}^2)$  and  $\vec{z}$  solves

$$\left\{ l_2 \frac{\partial}{\partial t} - a \mathbf{J}_2 \frac{\partial^4}{\partial x^4} - a \theta(t) l_2 \frac{\partial^3}{\partial x^3} + \hat{\mathbf{B}}_1(t, \mathbf{x}) \frac{\partial^2}{\partial x^2} + \hat{\mathbf{C}}_1(t, \mathbf{x}) \frac{\partial}{\partial x} \right\} \vec{z} = \dots,$$

- Note that  $\text{tr}(\hat{\mathbf{B}}_1(t, \mathbf{x})) \equiv \mathbf{0}$  and

$$\int_0^1 \text{tr}(\mathbf{J}_2 \hat{\mathbf{C}}_1(t, \mathbf{x})) d\mathbf{x} = -\frac{a}{2} \int_0^1 h_u(u_x, u_x) \frac{\partial}{\partial x} K(u) d\mathbf{x}.$$

We cannot expect the LHS to vanish in general unless  $K(u)$  is constant.

Thank you for your attention.
